AirLock Aviation Security Systems to debut new product at AEA Convention Washington D.C.

VIENNA, OH., April 24, 2008 – AirLock Aviation Security Systems, a leader in the development of aviation security products, announced the collaboration with Hawker Beechcraft Corporation to introduce the AirLock system for King Air models.

The Airlock system is an innovative lock system that easily converts existing mechanical locks into an electronic access control system. The system is made up of three components: a lock cylinder, the programmable key, and the software used to program the system. AirLock provides an improved locking device, allows programmable access to any area of the plane, and provides an audit trail to determine who has accessed the aircraft and when.

The system was developed to meet an increasing need for security in the general aviation industry. “Aircraft theft has always been a concern, but now more than ever the general aviation industry is facing increased regulatory compliance for airports and ultimately for aircraft. AirLock has been designed to provide a simple solution to meeting these increase security requirements”, states Mr. Richard Hale, President and CEO of AirLock.

AirLock has selected Hawker Beechcraft as a launch partner in order to leverage its experience in bringing new technologies into the aviation industry. The King Air product line will be available exclusively through the RAPID parts supply network.

The certification process for the system has begun and is expected to be issued by early summer. AirLock expects to continue its certification efforts in the future to bring this technology to additional airframe manufactures in the upcoming year.

AirLock Aviation Security Systems, LLC was found in 2007 to develop and market a diverse line of technologies targeted at the general aviation industry. The AirLock system is the first in a line of products that company is currently working to bring to the commercial marketplace.
