AirLock Aviation Security Systems Announces FAA Certification Issuance

VIENNA, OH., January 30th, 2009 – AirLock Aviation Security Systems, a leader in the development of aviation security products, announced that the FAA has issued an STC for the King Air 200 and 300 model aircraft for the AirLock access control system.

The AirLock kit approved for installation on these aircraft is comprised of direct replacement locks and keys that enable an electronic access control system to be installed in the aircraft in a matter of hours. The system is comprised of three components: lock cylinders, programmable keys, and the software used to control and monitor the system. AirLock enables administrators to program both locks and keys to control access over any period of time. Additionally, the system provides an audit trail to determine who has accessed the aircraft and when.

“We are extremely pleased with the issuance of the STC for the King Air line of AirLock products. The certification team at Hawker Beechcraft provided valuable insight as we completed all DO-160E testing and the STC application. I am confident that this new access control will provide an effective solution to the increasing security concerns in the aviation industry”, states Mr. Richard Hale, President and CEO of AirLock.

The AirLock kits for the King Air will be available exclusively through Hawker Beechcraft’s Rapid Aircraft Parts Inventory and Distribution (RAPID) network. Once installed on the aircraft, AirLock provides customers with a training course designed to familiarize the administrator with the software and to illustrate the numerous access control options the system is capable of providing.

AirLock is continuing to expand its certification efforts into a wide range of Part 25 aircraft. The company expects the issuance of several additional STCs during 2009 covering a wide range of aircraft.

AirLock Aviation Security Systems, LLC was founded in 2007 to develop and market a diverse line of technologies targeted at the aviation industry. The AirLock electronic access control system is the first in a line of products that the company is currently working to bring to the commercial marketplace.
